                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to the cloning and sequencing of the cluster encoding a modular type I polykentase (PKS) enzyme involved in the biosynthesis of the macrolide antibiotic nystatin. The nystatin PKS is useful as antifungal antibiotics. The present sequence is a transcriptional activator encoding Streptomyces nour

CP acnes is also involved in infections of bone, joints and the central concrous system, however it is particularly involved in the inflammatory concrete the contraction of the central concrete the contraction of the sentence of lesions associated with acne vulgaris. A method for detecting the contacting a concrete that binds to the proteins of the invention of sample with a binding agent that binds to the proteins of the invention of an determining the amount of bound protein in the sample. The concrete considering the amount of bound protein in the sample of the invention of an antipolate sample of the proteins. The production of antibodies conspectifies for p. acnes proteins. These antibodies can be used to concretely attences and activity of p. acnes properties and concept treat p. acnes infections. The antibodies may also be used as consensuable agents for determining p. acnes presence, for example, by constitute agents for determining p. acnes presence, for example, by constitute agents for determining p. acnes presence, for example, by constitute the sequence data for this patent did not form part of the printed constitution, but was obtained in electronic format directly from MIPO can be the printed constitution of                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               enzyme linked immunosorbent assay (ELISA).
Note: The sequence data for this patent did not form specification, but was obtained in electronic format

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyvlitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to therefore treat P. acnes infections. The antibodies can be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cat fire, wipo.int/pub/published_pct_sequences.

The invent useful in developmental biology and in elucidating cell signalling the control of the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511) sequences (ABL101840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid genes from Drosophila and interactions -
                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                   sequences (ABL01840-
(ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention
                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; SEQ ID
